The self-replicating Hepatitis C virus (HCV) RNA molecule is useful for evaluating potential inhibitors of HCV replication. The HCV RNA molecule is also useful for efficiently establishing cell culture replication. The self-replicating polynucleotide molecule contains a 5'-NVR, where G at position 1 is substituted for A, and therefore provides an alternative to existing systems comprising a self-replicating HCV RNA molecule that, in conjunction with mutations in the HCV non-structural region, such as the G(2042)C/R mutations, transduces and/or replicates with greater efficiency. This sequence represents hepatitis C virus replicon R3-rep-5'G, a self-replicating HCV polynucleotide molecule created from the APGK12 (see ABK88573)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New self-replicating RNA molecules from Hepatitis C virus (HCV), which possess enhanced transduction or replication efficiency, useful for evaluating potential inhibitors of HCV replication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a self-replicating hepatitis C virus of polynucleotide molecule comprising a 5'-non translated region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Kukolj G,

The self-replicating Hepatitis C virus (HCV) RNA molecule is useful for evaluating potential inhibitors of HCV replication. The HCV RNA molecule is also useful for efficiently establishing cell culture replication. The self-replicating polynucleotide molecule contains a 5'-NTR, where G at position 1 is substituted for A, and therefore provides an alternative to existing systems comprising a self-replicating HCV RNA molecule that, in conjunction with mutations in the HCV non-structural region, such as the G(2042)C/R mutations, transduces and/or replicates with greater efficiency. This sequence represents hepatitis C virus replicon R3-rep, a molecule canguage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New self-replicating RNA molecules from Hepatitis C virus (HCV), who possess enhanced transduction or replication efficiency, useful for evaluating potential inhibitors of HCV replication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 8638 BP; 1766 A; 2558 C; 2441 G; 1873

                                                                                                               CC The invention describes a self-replicating hepatitis C virus (HCV) CC polynucleotide molecule comprising a 5'-non translated region (NTR), CC where guanine at position 1 is substituted for adenine, a HCV polyprotein CC region coding for a HCV polyprotein; and a 3'-NTR region. The self-CC replicating Hepatitis C virus (HCV) RNA molecule is useful for evaluating CC useful for efficiently establishing cell culture replication. The self-CC replicating polynucleotide molecule contains a 5'-NTR, where G at CC position 1 is substituted for A, and therefore provides an alternative to CC conjunction with mutations in the HCV non-structural region, such as the CC (2042)C/R mutations, transduces and/or replicates with greater CC efficiency. This sequence represents hepatitis C virus replicon S22-3, a CC self-replicating HCV polynucleotide molecule created from the replicon CC APGK12 (see ABK88753)

The invention relates to Hepatitis C virus (HCV) variants which include CC polynucleotides comprising non-naturally occurring HCV sequence and HCV CV variants that have a transfection efficiency and ability to survive CC subpassage greater than HCV that have wild-type polyprotein coding CC regions. The polynucleotides of the invention are useful for identifying CC replication of HCV in cells of the cell line. They are also useful for testing a compound for anti-viral properties and for inhibiting HCV CC infection. They are also useful for the generation of defined HCV virus stocks to develop in vitro and in vivo assays for virus neutralisation, CC attachment, penetration and entry, structure/function studies on HCV proteins and RNA elements and identification of new antiviral targets, a cystematic survey of cell culture systems and conditions to identify consistent of survey of cell culture systems and conditions to identify consistent for production of Adaptive HCV variants capable of more efficiency replication in cell culture, production of HCV variants with altered conhibitor evaluation including those supporting HCV variant replication, cell-free HCV replication assays, production of tell-free HCV replication assays, production of attenuated or defective HCV derivatives for expression of heterologous gene products conformations and for utilisation of the HCV corporations and for utilisation of the HCV corporations with appropriate receptors. Vaccine comprising these sequences is useful for inducing immunoprotection of HCV in a primate.

CC The present sequence is Hepatitis C virus (HCV) adaptive replicon 5'NTR-CC EmCV/HCVrepVII cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hepatitis C virus variants having greater transfection efficiency and ability to survive subpassage, useful as a vaccine for immunizing primate to the virus, comprise non-naturally occurring viral sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 2; Page 100-102; 174pp; English.

Hepatitis C virus variants having greater transfection efficiency ability to survive subpassage, useful as a vaccine for immunizing to the virus, comprise non-naturally occurring viral sequences. / and | primate

Example 2; Page 90-92; 174pp; English.

The invention relates to Hepatitis C virus (HCV) variants which include polynucleotides comprising non-naturally occurring HCV sequence and HCV variants that have a transfection efficiency and ability to survive subpassage greater than HCV that have wild-type polyprotein coding regions. The polynucleotides of the invention are useful for identifying a cell line that is permissive for infection with HCV and detecting resplication of HCV in cells of the cell line. They are also useful for testing a compound for anti-viral properties and for inhibiting HCV infection. They are also useful for the generation of defined HCV virus stocks to develop in vitro and in vivo assays for virus neutralisation, attachment, penetration and entry, structure/function studies on HCV proteins and RNA elements and identification of new antiviral targets, a systematic survey of cell culture systems and conditions to identify those that support wild-type and variant HCV RNA replication and particle particle

ability to survive subpassage, useful as a vaccine for immunizing primate to the virus, comprise non-naturally occurring viral sequences.

laim 44; Page 66-69; 174pp; English.

The invention relates to Hepatitis C virus (HCV) variants which include CC polynucleotides comprising non-naturally occurring HCV sequence and HCV variants that have a transfection efficiency and ability to survive CC variants. The polynucleotides of the invention are useful for identifying CC a cell line that is permissive for infection with HCV and detecting CC reglication of HCV in cells of the cell line. They are also useful for testing a compound for anti-viral properties and for inhibiting HCV constants of develop in vitro and in vivo assays for virus neutralisation, attachment, penetration and entry, structure/function studies on HCV constants curvey of cell culture systems and conditions to identify consistent support wild-type and variant HCV RNA replication and particle consistency replication in cell culture, production of HCV variants with altered consistency replication including those supporting HCV variants with altered consistency consistency of cell-free HCV replication assays, production of development of cell-free HCV replication assays, production of development of cell-free HCV replication assays, production of cell-free HCV replication, engineering of attenuated HCV constitutes as possible vaccine candidates, engineering of attenuated or defective HCV particles for expression of heterologous gene products for gene therapy and vaccine applications and for utilisation of the HCV constitutes for respective HCV replication assays, production of the HCV constitutes for respective HCV replication assays, production of attenuated or other cell types with appropriate receptors. Vaccine comprising these sequences is useful for inducing immunoprotection to HCV in a primate.

CC The present sequence is Hepatitis C virus (HCV) replibBartMan/delta2U's cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
The invention relates to Hepatitis C virus (HCV) variants which include polynucleotides comprising non-naturally occurring HCV sequence and HCV variants that have a transfection efficiency and ability to survive subpassage greater than HCV that have wild-type polyprotein coding regions. The polynucleotides of the invention are useful for identifying a cell line that is permissive for infection with HCV and detecting replication of HCV in cells of the cell line. They are also useful for testing a compound for anti-viral properties and for inhibiting HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hepatitis
Synthetic.
                                                                                                                                                                                                                                                                                    Hepatitis C virus variants having greater transfection efficiency ability to survive subpassage, useful as a vaccine for immunizing to the virus, comprise non-naturally occurring viral sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hepatitis C virus; HCV; transfection; infection; virus neutralis; gene therapy; vaccine; immunoprotection; hepatotropic; virucide; adaptive replicon VI; mutant; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC infection. They are also useful for the generation of defined HCV virus colors to develop in vitro and in vivo assays for virus neutralisation, CC attachment, penetration and entry, structure/function studies on HCV CC proteins and RNA elements and identification of new antiviral targets, a CC systematic survey of cell culture systems and conditions to identify CC those that support wild-type and variant HCV RNA replication and particle CC release, production of adaptive HCV variants capable of more efficiency CC replication in cell culture, production of HCV variants with altered CC tissue or species tropism, establishment of alternative animal models for CC inhibitor evaluation including those supporting HCV variant replication, CC development of cell-free HCV replication assays, production of immunogenic HCV particles for vaccine candidates, engineering of attenuated or CC derivatives as possible vaccine candidates, engineering of attenuated or CC defective HCV derivatives for expression of heterologous gene products for gene therapy and vaccine applications and for utilisation of the HCV glycoproteins for targetted delivery of therapeutic agents to the liver or other cell types with appropriate receptors. Vaccine comprising these sequences is useful for inducing immunoprotection to HCV in a primate. This sequence is generated by the mutation g to t at position CC Sisé of HCVPerolbartman/Avalic CDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel Hepatitis C virus (HCV) cell culture system compising human hepatoma cells that contain an integrated HCV-RNA construct (1). (1) contains the HCV-specific RNA segments 5'-NTR (non-translated region), NS (non-structural)3, NS4A, NS4B, NS5A, NS5B and 3'-NTR, and a selectable (marker) gene (II). The cell cultures, and/or (I), are used to:prepare, evaluate and/or test therapeutic and/or diagnostic agents for HCV infections, and to prepare vaccines against HCV infection (particularly preparation of attenuated HCV). The can also be used for preparation of a liver-specific delivery system for gene therapy, and to identify cells permissive for HCV replication. Virus RNA replicates autonomously and with high efficiency in this cellular system, so that variations in replication rates can be measured (for screening antiviral agents) quantitatively or qualitatively, using standard laboratory equipment. Efficient replication of HCV RNA is only achieved when the specified RNA segments are present and when the transfected cells are maintained under permanent selection pressure
                                                                                                                                                                                                                                                                                                                                Query Match

CC regions. The polymucleotides of the invention are useful for identifying CC a cell line that is permissive for infection with HCV and detecting CC replication of HCV in cells of the cell line. They are also useful for CC testing a compound for anti-viral properties and for inhibiting HCV CC infection. They are also useful for the generation of defined HCV virus stocks to develop in vitro and in vivo assays for virus neutralisation, CC stachment, penetration and entry, structure/function studies on HCV CC proteins and RNA elements and identification of new antiviral targets, a csystematic survey of cell culture systems and conditions to identify CC those that support wild-type and variant HCV RNA replication and particle crelease, production of adaptive HCV variants capable of more efficiency crelication in cell culture, production of HCV variants with altered CC release, production including those supporting HCV variant models for inhibitor evaluation including those supporting HCV variant replication, CC immunogenic HCV particles for vaccination, engineering of attenuated or defective HCV derivatives for excentation, engineering of attenuated or defective HCV derivatives for expression of heterologous gene products of conther cell types with appropriate receptors. Vaccine comprising these sequences is useful for inducing immunoprotection to HCV in a primate. The content is Hepatitis C virus (HCV) replication to HCV in a primate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to Hepatitis C virus (HCV) variants which incl polynucleotides comprising non-naturally occurring HCV sequence and variants that have a transfection efficiency and ability to survive subpassage greater than HCV that have wild-type polyprotein coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 44; Page 69-71; 174pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis C virus variants having greater transfection efficiency ability to survive subpassage, useful as a vaccine for immunizing to the virus, comprise non-naturally occurring viral sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              primate

The invention relates to Hepatitis C virus (HCV) variants which include polynucleotides comprising non-naturally occurring HCV sequence and HCV variants that have a transfection efficiency and ability to survive subpassage greater than HCV that have wild-type polyprotein coding regions. The polynucleotides of the invention are useful for identifying a cell line that is permissive for infection with HCV and detecting replication of HCV in cells of the cell line. They are also useful for testing a compound for anti-viral properties and for inhibiting HCV infection. They are also useful for the generation of defined HCV virus stocks to develop in vitro and in vivo assays for virus neutralisation,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC attachment, penetration and entry, structure/function studies on HCV CC proteins and RNA elements and identification of new antiviral targets, a CC systematic survey of cell culture systems and conditions to identify CC those that support wild-type and variant HCV RNA replication and particle CC release, production of adaptive HCV variants capable of more efficiency CC replication in cell culture, production of HCV variants with altered CC tissue or species tropism, establishment of alternative animal models for CC inhibitor evaluation including those supporting HCV variant replication, CC development of cell-free HCV replication assays, production of attenuated HCV communogenic HCV particles for vaccination, engineering of attenuated HCV derivatives as possible vaccine candidates, engineering of attenuated or CC defective HCV derivatives for expression of heterologous gene products CC glycoproteins for targetted delivery of therapeutic agents to the liver CC glycoproteins for targetted delivery of therapeutic agents to the liver CC or other cell types with appropriate receptors. Vaccine comprising these CC Sequences is useful for inducing immunoprotection to HCV in a primate. CC The present sequence is Hepatitis C virus (HCV) adaptive replicon V CC mutant cDNA. This sequence is generated by the mutation g to t at CC position 5320 of HCVreplbBartMan/AvaII cDNA

AAD25325
The invention relates to Hepatitis C virus (HCV) variants which include CC polynucleotides comprising non-naturally occurring HCV sequence and HCV variants that have a transfection efficiency and ability to survive CC subpassage greater than HCV that have wild-type polyprotein coding regions. The polynucleotides of the infection with HCV and detecting CC a cell line that is permissive for infection with HCV and detecting CC replication of HCV in cells of the cell line. They are also useful for testing a compound for anti-viral properties and for inhibiting HCV concerns and evelop in vitro and in vivo assays for virus neutralisation, attachment, penetration and entry, structure/function studies on HCV concerns and RNA elements and identification of new antiviral targets, a compound the cell culture systems and conditions to identify those that support wild-type and variant HCV RNA replication and particle release, production of adaptive HCV variants capable of more efficiency consisted the replication in cell culture, production of HCV variants with altered CC inhibitor evaluation including those supporting HCV variant replication, cell culture, production assays, production of cell culture, production of alternative animal models for inmunogenic HCV particles for vaccination, engineering of attenuated or deferivatives as possible vaccine candidates, engineering of attenuated or defective HCV derivatives for expression of heterologus gene products for glycoproteins for targetted delivery of therapeutic agents to the liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hepatitis C virus variants having greater transfection efficiency ability to survive subpassage, useful as a vaccine for immunizing to the virus, comprise non-naturally occurring viral sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 23-MAY-2001; 2001WO-US016822

CC The present sequence comprises a replicating hepatitis C virus (HCV) H77

CC (BB7-F1) sub-genomic replicon. The invention provides sub-genomic replicons of HCV comprising a nucleic acid construct encoding chimeric CC (FV nonstructural protein and an NSSB polymerase gene. A preferred CC replicon comprises an NS3 mucleotide sequence ADD93721 that encodes the CT first 75 contiguous N-terminal amino acids of the NS3 of genotype 1b, of CC a BB7 strain. A chimeric replicon may comprise an NS3 sequence from any CC first 6 major HCV genotypes and subtypes but has its first 25 contiguous N-tCV genotypes and subtypes but has its first 25 concleotides of the coding sequence replaced by the BB7 strain NS3 CC sequence, especially where the replicon is from HCV genotype 1a (H77 CC strain) or genotype 1b (J4 strain). Stable cell lines expressing and CC replicating functional replicons containing sequences from HCV genotype CC 1a (strain H77) or genotype 1b (strain J4) within the prototype 1b (CC replicon backbone from HCV strain BB7 are provided. These can be used to CC screen for compounds that modulate viral replication. The sub-genomic HCV ceplicon systems of the invention may provide the foundation for CC frequence screening, testing and evaluating anti-infective agents for HCV distance (a)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New hepatitis C virus (HCV) sub-genomic replicon, useful for facilitating screening or testing of anti-HCV drugs, comprises a nucleic acid construct encoding chimeric HCV non-structural proteins, and an NSSB
